

What to test?

Levels of tests

- Like levels of requirements
- Lower level → Easier
- Higher level → More confidence

Functions

```
int sum(int... ints) {  
    int sum = 0;  
    for (int i : ints) {  
        sum += i;  
    }  
    return sum;  
}
```

@Test

```
void sumOfOneToThreeIsSix() {  
    assertThat(sum(1, 2, 3), is(6));  
}
```

Modules

```
/** Posts the given text  
    as the current user  
    to the forum. */  
void postMessage (String text);
```

Context

Make dependencies explicit

```
class User { ... }  
interface AuthService {  
    User getCurrentUser();  
}  
interface HttpClient {  
    String post(String url, String body);  
}  
void postMessage(String text,  
                  AuthService auth,  
                  HttpClient client);
```

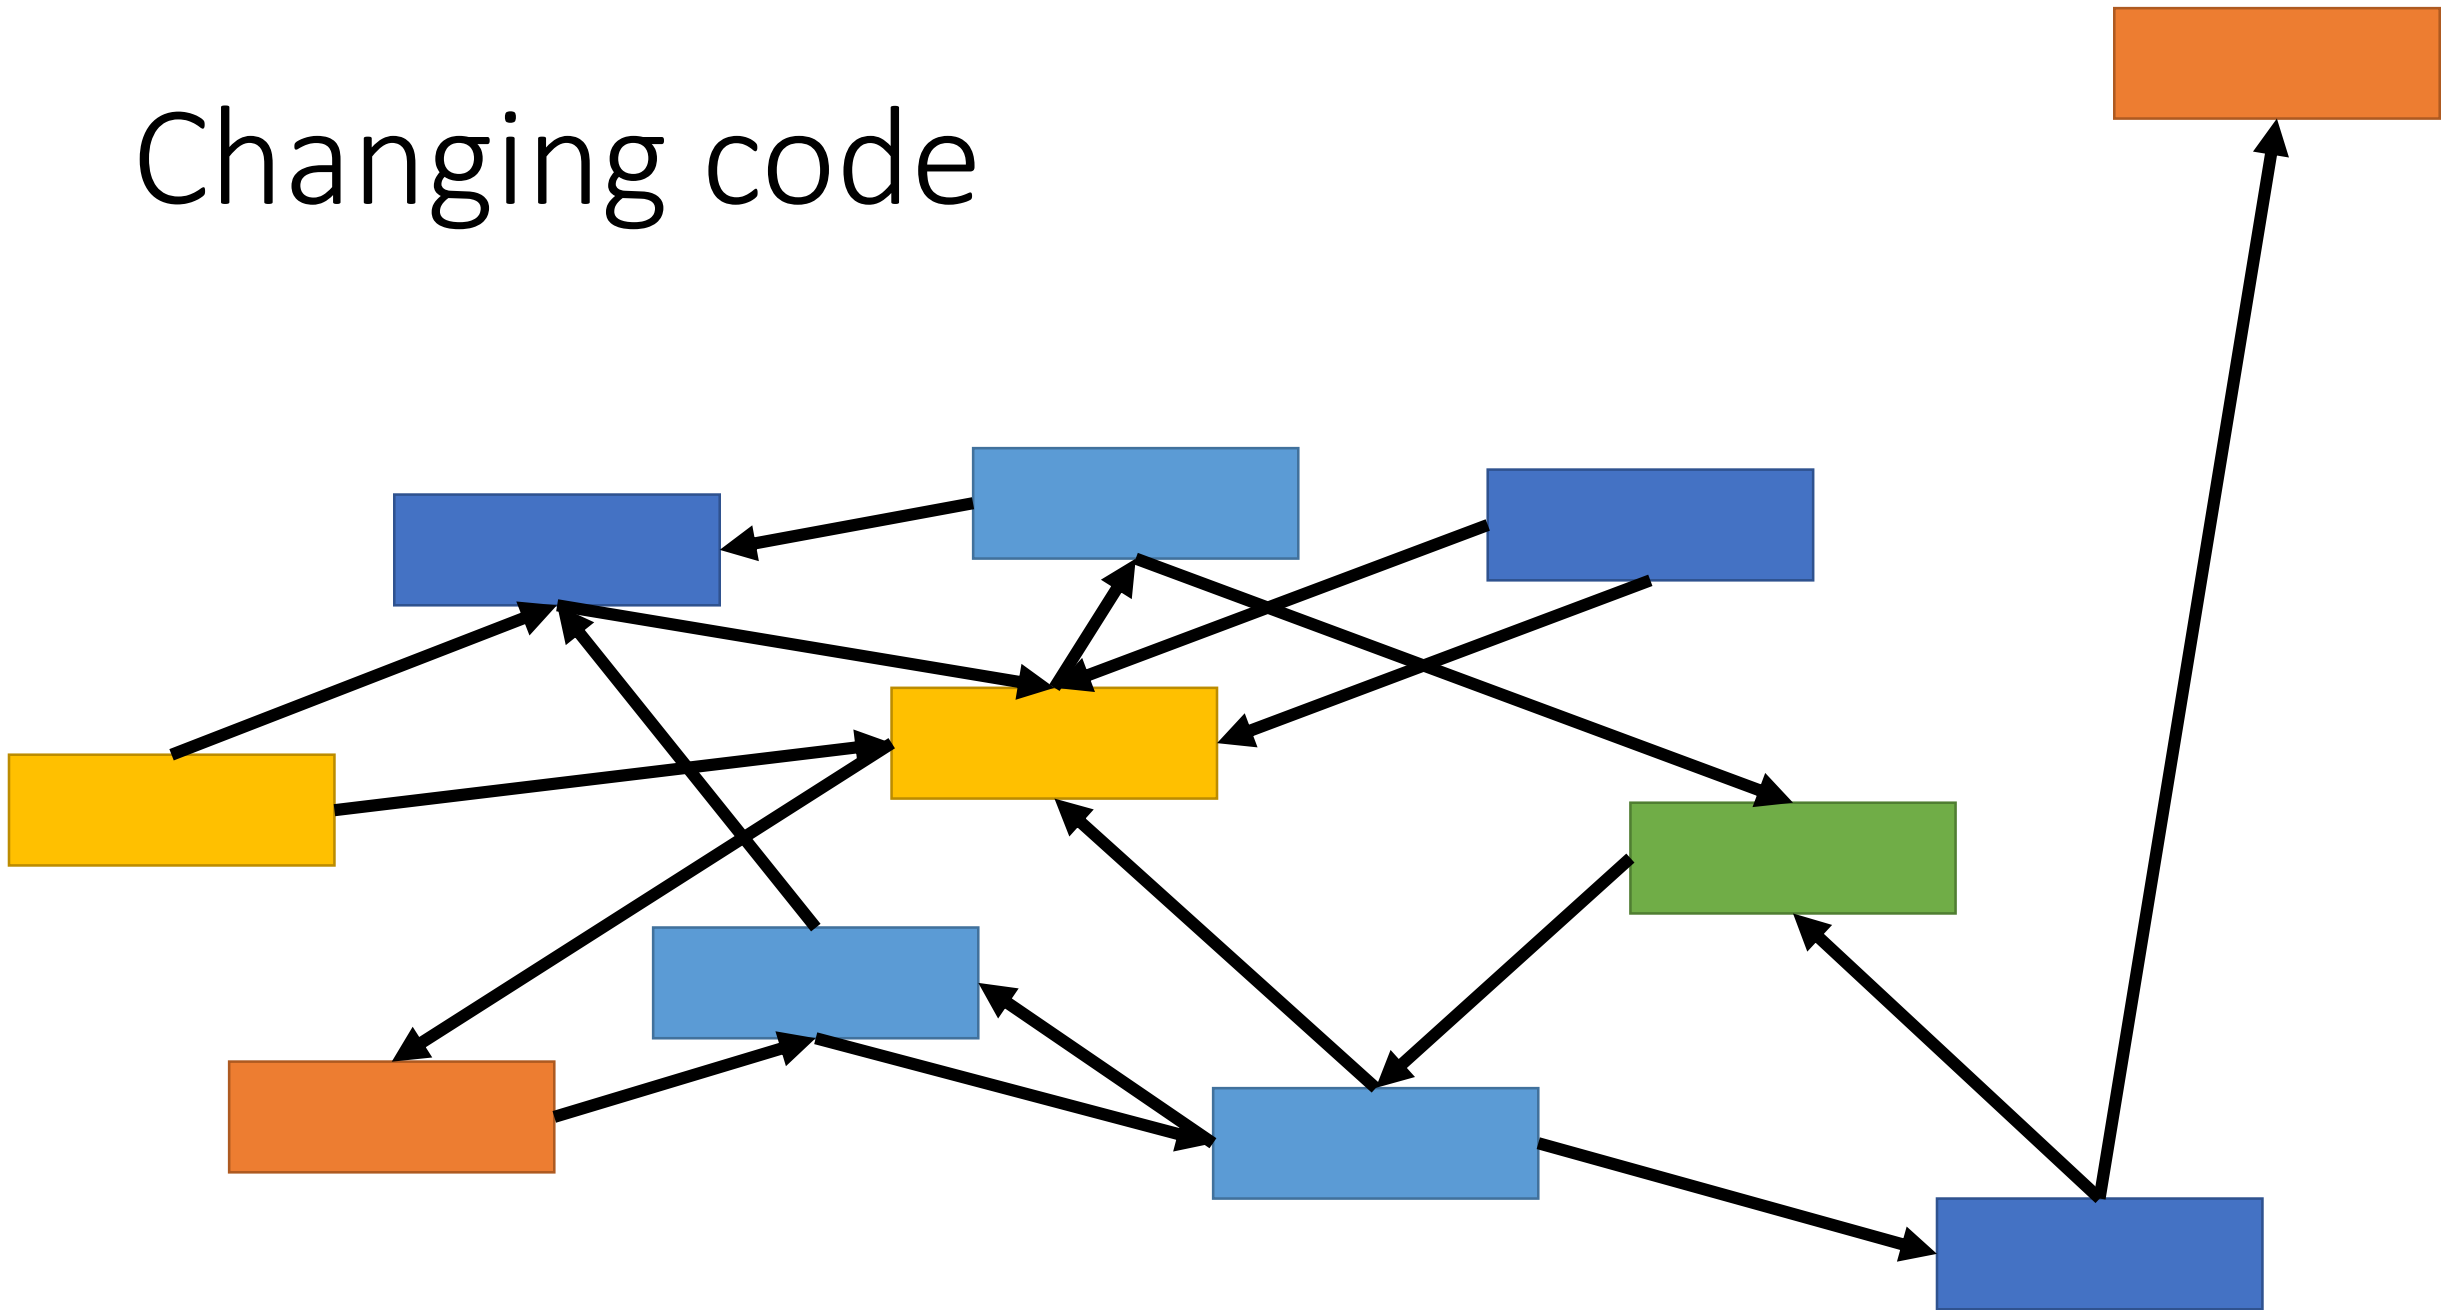

Inject fake dependencies

```
AuthService auth = new AuthService() {  
    @Override  
    public User getCurrentUser() {  
        return null;  
    }  
};  
HttpClient client = ...;  
assertThrows(  
    IllegalStateException.class,  
    () -> postMessage("Hi", auth, client));
```

Test dependency calls

```
HttpClient client = new HttpClient() {  
    @Override  
    public String post(String url,  
                        String body) {  
        assertThat(body, is("MSG: Hi"));  
        return "OK";  
    }  
};
```
